

**IN THE SPECIFICATION:**

***Please amend paragraph [0026] on page 9, with the following paragraph:***

The preferably water-cooled diesel engines and aggregates are covered jointly by a sound-proof capsule. This is also advantageous in that the sensitive components of the system are protected from a contamination in the case of an ABC by NBC attack. The cooling water circuits of the engine, the exhaust gas cooler, the generator and the interior compartment (radiation), which are separate for thermal reasons, are guided to joint heat exchanger units which, corresponding to their size, are cooled by several fans (preferably axial-flow fans) by means of ambient air. In order not to enlarge the construction volume of the entire system by the empty space for guiding the cooling air, the heat exchangers are movably linked to hinges and the cooling water is fed and removed through hoses.

***Please amend paragraph [0044] bridging pages 14 and 15, with the following paragraph:***

[0001] Important additional components are the battery bank, the by NBC ABC-tight and sound-proof capsule 43 of the water-cooled engines, the exhaust gas coolers as well as the generators. The water cooling of the engines preferably takes place in thermally separated circuits which are guided to the exterior air-cooled heat exchangers with fans 44, 44'. In the interest of compactness and the capability

to decontaminate by NBC ABC-warfare agents of the overall system, the heat exchangers are folded-out for the operation.

***Please amend paragraph [0047] on page 15, with the following paragraph:***

The limited cargo space for air freight requires the lifting-off or folding-up of the ~~higher-adjustable~~ height-adjustable hitch 46.
